KEY GENERATION ALGORITHM FOR SECURITY UNLOCK

1 Security Unlock procedure

The below flowchart indicates the request and response sequence followed to unlock security

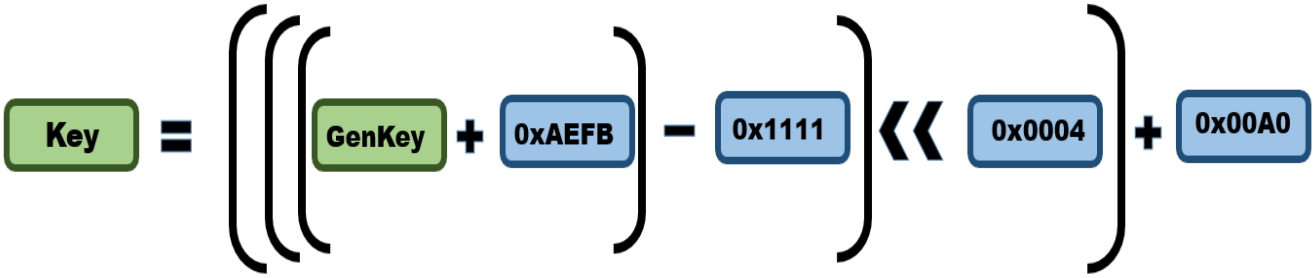

Note: Current implementation support only one security level (01)

2 Key Generation

For generation of the two byte Key, the Seed Higher and Lower Bytes are combined and the key generation algorithm is applied, as shown below:

If the computed Key is more than 2 bytes, only the lower 2 bytes are considered.

Example:

Request	**Response from tester**
27 01	**67 01 02 03**
Now, GenKey = 02 03 Key = (((0203+AEFB)-1111)<<0004)+00A0) = 0x9FF70 Consider only the lower 2 bytes, hence **Key = 0xFF70**	
27 02 FF 70	**67 02**
